

## Painlevé-Umemura Extensions

By

K. NISHIOKA

(Keio University at SFC, Japan)

### 1. Introduction

Let  $K$  be a differential field of characteristic 0 and  $U$  be a universal extension of  $K$ . In what follows, unless otherwise stated, differential field extensions of  $K$  concerned will be assumed to be finitely generated, hence have  $U$  as a universal extension. For a differential field extension  $L$  of  $K$  by  $C_L$  we denote the field of constants of  $L$ .

Let  $R$  be a differential field extension of  $K$ . We say that  $R$  depends rationally on arbitrary constants over  $K$  if there exists a differential field extension  $E$  of  $K$  such that  $E$  and  $R$  are free over  $K$  and the equality  $ER = EC_{ER}$  holds.

Recent discussions on Painlevé's first transcendent motivate the following (cf. [9], [10], [11]).

**Definition.** A differential field extension  $R$  of  $K$  is called a *Painlevé-Umemura (PU-)* extension of  $K$  if there exists a finite chain of differential field extensions of  $K$ :  $K = R_0 \subset R_1 \subset \cdots \subset R_m$  such that  $R_m = R$  and  $R_{i+1}/R_i$  depends rationally on arbitrary constants for each  $i$ . For instance, liouville extensions, or more widely,  $H$ -extensions defined in [4] are *PU*-extensions.

The aim of this note is to prove the following.

**Theorem.** *Suppose that a differential field extension  $R$  of  $K$  is contained in a certain *PU*-extension of  $K$ . Then  $R$  is itself a *PU*-extension of  $K$ .*

### 2. Invariant subfields

Let  $F$  be a field of characteristic 0 and  $t$  be an indeterminate over  $F$ . By  $F[[t]]$  we denote the ring of formal power series in  $t$  with coefficients from  $F$ . Every ring homomorphism  $\sigma$  of  $F$  to  $F[[t]]$  is always assumed to assign the unity to the unity. Let  $\Sigma$  be a set of such isomorphisms. For a subfield  $E$  of  $F$  with  $\Sigma E \subset E[[t]]$ , by  $E^\Sigma$  we denote the set of all  $e$  in  $E$  that are left invariant under every isomorphism in  $\Sigma$ . This set is a subfield of  $E$ . (cf. Kolchin [2, pp. 86–88].)

**Lemma 1.** *Let  $E$  be a subfield of  $F$  with  $\Sigma E \subset E[[t]]$ . Then  $F^\Sigma$  and  $E$  are linearly disjoint over  $E^\Sigma$ .*

*Proof.* Suppose a finite number of elements  $f_i$  of  $F^\Sigma$  to be linearly dependent over  $E$ . There exists a nontrivial linear combination of the  $f_i$  over  $E$  which vanishes. Among such linear combinations pick up the shortest one, say  $\sum e_i f_i = 0$ , where the  $e_i$  are nonzero elements of  $E$ . We may assume  $e_i = 1$  for some  $i$ . Applying  $\sigma \in \Sigma$ , through subtraction,  $\sum (e_i - \sigma e_i) f_i = 0$ . By our assumption on the sum, the coefficients of the linear combination must be all zero. It thus follows every  $e_i$  lies in  $E^\Sigma$ . This is our assertion.

**Lemma 2.** *Let  $E$  be a subfield of  $F$ . Suppose  $F = EF^\Sigma$ . Then any intermediate field  $H$  between  $E$  and  $F$  satisfying  $\Sigma H \subset H[[t]]$  has the property  $H = EH^\Sigma$ .*

*Proof.* We know that  $F^\Sigma$  and  $H$  are linearly disjoint over  $H^\Sigma$ . Hence  $EF^\Sigma$  and  $H$  are also linearly disjoint over  $EH^\Sigma$  since  $H^\Sigma \subset EH^\Sigma \subset H$ . Let  $h$  be in  $H$ . If  $h \notin EH^\Sigma$ , then  $h \notin EF^\Sigma$ . This contradicts the assumption  $F = EF^\Sigma$ . Thus  $H \subset EH^\Sigma$ , therefore  $H = EH^\Sigma$ .

**Lemma 3.** *Let  $I$  be a subfield of  $F$  and  $E, J$  be intermediate fields between  $I$  and  $F$ . Suppose that  $E$  and  $J$  are linearly disjoint over  $I$ ,  $\Sigma E \subset E[[t]]$  and  $E^\Sigma = I$ . Then every isomorphism in  $\Sigma$  can be extended to an isomorphism of  $JE$  to  $JE[[t]]$  which is trivial on  $J$  and in this sense  $(JE)^\Sigma = J$  holds.*

*Proof.* Clearly  $J \subset (JE)^\Sigma$ . To show the converse relation let  $x$  be an element of  $(JE)^\Sigma$ . It has the expression

$$x = \frac{\sum a_i x_i}{\sum b_j y_j},$$

where the  $a_i$  and the  $b_j$  are in  $E$ , the  $x_i$  and the  $y_j$  are in  $J$ , and  $\sum b_j y_j \neq 0$ . We may assume without losing generality that the  $x_i$  are linearly independent over  $I$  therefore  $J$  and  $b_j = y_j = 1$  for some  $j$ . Among such expressions pick one such that the occurrence of nonzero  $b_j$  is the minimum in number. Applying  $\sigma \in \Sigma$ , we have

$$x \sum (a_i - \sigma a_i) x_i - \sum (b_j - \sigma b_j) y_j = 0.$$

The minimality implies  $b_j = \sigma b_j$  and then  $a_i = \sigma a_i$  by the linear independence of the  $x_i$ . This completes the proof.

The results apply to the proof of the following known fact: Let  $L$  be a differential field extension of  $K$  and  $M$  be a differential field extension of  $L$ . Assume  $M \subset LC_U$ . Then  $M = LC_M$ . In fact let  $\sigma = \exp tD$ , where  $D$

denotes the differentiation of  $M$ , and  $\Sigma = \{\sigma\}$ . By Lemma 2  $(LC_U)^\Sigma = C_U$  and Lemma 1 implies our assertion.

### 3. Rational dependence

Let  $K$  be a differential field of characteristic 0 and  $R$  be a differential field extension of  $K$ . Denote by  $\Pi_K(R)$  the set of all intermediate differential fields between  $K$  and  $R$  that depend rationally on arbitrary constants over  $K$ . According to the last sentence in the previous section, the element  $P$  of this set is characterized by the property that there exists a differential field extension  $E$  of  $K$  such that  $P$  and  $E$  are free over  $K$  and the compositum  $EP$  is generated by constants over  $E$ . We shall here prove that this set has the maximum element in the inclusion order and discuss its fundamental property. At the end of this section a proof of the Theorem will be given.

**Proposition 1.** *For  $P \in \Pi_K(R)$  there is a differential field  $E$  of  $K$  such that  $R$  and  $E$  are free over  $K$  and  $EP = EC_{EP}$ .*

*Proof.* By definition there is a differential field extension  $F$  of  $K$  such that  $P$  and  $F$  are free over  $K$  and  $FP/F$  is generated by constants. According to the following lemma there is a differential field extension  $Q$  of  $P$  such that  $FR$  and  $Q$  are free and differentially isomorphic over  $P$ . As  $E$  we may take the image of  $F$ .

**Lemma 4.** *There is a differential field extension  $S$  of  $K$  such that  $R$  and  $S$  are free and differentially isomorphic over  $K$ .*

*Proof.* Let  $L$  denote the algebraic closure of  $K$  in  $R$ . Then  $R/K$  is regular. The quotient field  $\langle R \otimes_L R \rangle$  of the differential domain  $R \otimes_L R$  is expressible as the compositum of two differential fields  $R \otimes_L 1$  and  $1 \otimes_L R$ . Identifying the former with  $R$  and denoting the latter by  $S$ , we have the desired conclusion.

**Proposition 2.** *The set  $\Pi_K(R)$  has the maximum element.*

*Proof.* Let  $P$  and  $Q$  be in  $\Pi_K(R)$ . Then there is a differential field extension  $E$  of  $K$  such that  $R$  and  $E$  are free over  $K$  and  $EP/E$  is generated by constants. Since  $Q \in \Pi_K(ER)$  also holds there exists a differential field extension  $F$  of  $K$  such that  $ER$  and  $F$  are free over  $K$  and  $FQ/F$  is generated by constants. Hence  $EFQ/EF$  is generated by constants, therefore  $PQ \in \Pi_K(R)$ .

In the sequel this maximum element of  $\Pi_K(R)$  will be denoted  $P_K(R)$ .

**Proposition 3.** *Let  $E$  be a differential field extension of  $K$  for which  $R$*

and  $E$  are free over  $K$ . Then  $EP \in \Pi_E(ER)$  for any  $P \in \Pi_K(R)$  and  $R \cap Q \in \Pi_K(R)$  for any  $Q \in \Pi_E(ER)$ .

*Proof.* Assume  $P \in \Pi_K(R)$ . Since  $P\Pi_K(ER)$ , by Proposition 1, there exists a differential field extension  $F$  of  $K$  such that  $ER$  and  $F$  are free over  $K$  and  $FP/F$  is generated by constants. This shows that  $EFP/EF$  is generated by constants, therefore  $EP \in \Pi_E(ER)$ . Assume next  $Q \in \Pi_E(ER)$  and let  $P = Q \cap R$ . Then we have a differential field  $F$  of  $E$  such that  $ER$  and  $F$  are free over  $E$  and  $FQ/F$ , hence  $FP/F$ , is generated by constants. This completes the proof.

**Proposition 4.** *Let  $P \in \Pi_K(R)$  and  $\sigma$  be a differential isomorphism of  $R$  into  $U$ . Then  $\sigma P \in \Pi_{\sigma K}(\sigma R)$ .*

*Proof.* Take a differential field extension  $E$  of  $K$  such that  $R$  and  $E$  are free over  $K$  and  $EP/E$  is generated by constants. It is known that there exists an extension  $\tau$  of  $\sigma$  which is a differential isomorphism of  $ER$  into  $U$ . Clearly  $\tau R = \sigma R$  and  $\tau E$  are free over  $\tau K = \sigma K$ . Since  $EP/E$  is generated by constants it follows that  $\tau(E)\sigma(P)/\tau E$  is generated by constants as well. This completes the proof.

**Proposition 5.** *Let  $E$  be a differential field extension of  $K$  which is free from  $R$  over  $K$ . Then  $R$  and  $P_E(ER)$  are linearly disjoint over  $P_K(R)$ . In particular*

$$P_E(ER) = EP_K(R), P_K(R) = R \cap P_E(ER).$$

*Proof.* Now suppose that nonzero elements  $(a_i)_{1 \leq i \leq m}$  of  $R$  are linearly dependent over  $P_E(ER)$ . Let  $L$  denote the algebraic closure of  $K$  in  $R$  and  $\Phi$  be the set of all differential field extension of  $L$  from which  $R$  is free over  $L$ . For each  $A \in \Phi$  by  $n(A)$  we denote the dimension of the  $P_A(AR)$ -vector space generated by the  $a_i$ . There is an  $F \in \Phi$  with  $n = n(F)$  being the minimum. We may suppose that the elements  $(a_i)_{1 \leq i \leq n}$  constitute the base for the vector space generated by the  $a_i$ . Any other element  $a = a_i$  has the expression

$$a = \sum_{i=1}^n x_i a_i, x_i \in P_F(FR).$$

Let  $M$  denote the algebraic closure of  $L$  in  $F$ . The quotient field  $\langle F \otimes_M F \otimes_M MR \rangle$  is considered as a differential subfield of  $U$ , and written  $F_1 F_2 R$ , where  $F_1$  stands for  $F \otimes_M 1$  and  $F_2$  stands for  $1 \otimes_M F$ . The mappings  $\sigma_j: F \rightarrow F_j$  defined by

$$\sigma_1(x) = x \otimes 1, \sigma_2(x) = 1 \otimes x$$

are differential isomorphisms over  $M$ . These are also regarded as differential

isomorphisms of  $FR$  into  $F_1F_2R$  over  $MR$ . Applying  $\sigma_j$  to the above equality, through subtracting, we have

$$\sum_{i=1}^n (\sigma_1 x_i - \sigma_2 x_i) a_i = 0.$$

Since the elements  $x_i$  are all contained in  $P_F(FR)$ , by Proposition 4, it follows

$$\sigma_j x_i \in P_{F_j}(F_j R),$$

whence

$$\sigma_1 x_i - \sigma_2 x_i \in P_{F_1 F_2}(F_1 F_2 R).$$

By our assumption we see the  $(a_i)_{1 \leq i \leq n}$  are linearly independent over  $P_{F_1 F_2}(F_1 F_2 R)$ . This implies  $\sigma_1 x_i = \sigma_2 x_i$ , whence  $x_i \in MR$ , and  $\in P_M(MR)$ . (See Sublemma (25.5) in [10].) We must show  $x_i \in P_K(R)$ . To this end let  $N$  be a Galois extension of  $L$  including  $M$ . Since  $N$  and  $R$  are linearly disjoint over  $L$ , every automorphism  $\sigma$  of  $N/L$  is regarded as a differential automorphism of  $NR/R$ . By Proposition 4, we see  $\sigma x_i \in P_N(NR)$ . From the equality

$$\sum_{i=1}^n (x_i - \sigma x_i) a_i = 0$$

we find that  $x_i = \sigma x_i$  for each  $\sigma$ , hence  $x_i \in R$ , using Lemma 3. This completes the proof.

**Proposition 6.** *Let  $S$  be a differential field extension of  $R$ . Set  $R_0 = S_0 = K$  and for each  $i \geq 1$*

$$R_i = P_{R_{i-1}}(R), \quad S_i = P_{S_{i-1}}(S).$$

*Then for any  $i$ ,  $R$  and  $S_i$  are linearly disjoint over  $R_i$ .*

*Proof.* The proof proceeds by induction on  $i$ . In case  $i = 0$ , it is trivial. Let us first show the assertion in case  $i = 1$ . Let  $M$  denote the algebraic closure of  $K$  in  $S$  and take  $E$  to be a differential field extension of  $M$  such that  $S$  and  $E$  are linearly disjoint over  $M$  and  $ES_1 = EC_{ES}$ . Then  $ER_1 = EC_{ER}$ . Since  $ER$  and  $C_{ES}$  are linearly disjoint over  $C_{ER}$ , it follows that  $ER$  and  $ES_1 = ER_1 C_{ES}$  are linearly disjoint over  $ER_1$ . By the way,  $MR$  and  $E$  are linearly disjoint over  $M$ , whence  $MR$  and  $ES_1$  are linearly disjoint over  $MR_1$ . We also know that  $R$  and  $MR_1$  are linearly disjoint over  $R_1$ , since  $R_1$  includes the algebraic closure of  $K$  in  $R$ . By this we conclude that  $R$  and  $ES_1$  are linearly disjoint over  $R_1$ . Now assume  $i$  is positive and the assertion in case  $i - 1$  holds validly. Since  $R$  and  $S_{i-1}$  are linearly disjoint over  $R_{i-1}$ , by Proposition 5,  $R$  and  $P_{S_{i-1}}(S_{i-1}R)$  are linearly disjoint over  $R_i = P_{R_{i-1}}(R)$ . By

the fact obtained just above, noting  $S_{i-1} \subset S_{i-1}R \subset S$ , we have  $S_{i-1}R$  and  $S_i$  are linearly disjoint over  $P_{S_{i-1}}(S_{i-1}R)$ . These verify the assertion in case  $i$ .

*Proof of Theorem.* By hypothesis there exists a  $PU$ -extension  $S$  of  $K$  containing  $R$ . As above we can construct the differential subfields of  $R$  and  $S$ :

$$R_i = P_{R_{i-1}}(R), \quad S_i = P_{S_{i-1}}(S) \quad (i \geq 1); \quad R_0 = S_0 = K.$$

According to the above proposition  $R_i = R \cap S_i$ . Since  $S = S_m$  for some integer  $m$  it follows that  $R_m = R \cap S$ , which shows that  $R$  is a  $PU$ -extension of  $K$ .
